"I was very satisfied with the professionalism of the company and with their understanding transparency."

- Steven H, Client

Project Highlights

2,000 SF FIRE SAFE HOME

This new 2,000 sq. ft. contemporary hillside home was constructed on a lot where the original home was destroyed in the 2009 Jesusita Fire. With that history in mind, architect Peter Becker designed a custom home with classic contemporary design elements as well as fire resistant features that will give the home a greater chance of survival should another wildland fire occur.

Home features include:

- Urethane finished exterior decks that are not only fire resistant but waterproof as well.
- Large roof extensions over south facing windows that provide shade and reduce heat gain in summer months.
- Decorative bands of painted, cement board trim creating horizontal and vertical bands of color on all faces that add to the contemporary style of the home.
- Large floor-to-ceiling windows allow abundant natural light into interior spaces.
- 18 ft. ceilings in the living room and master bedroom create the illusion that the spaces are larger than they are.
